LAB- Using Wire Tap

In this lab you will be understanding how to use WireTap as a channel interceptpr

In this lab, you will be working on **04-using-wiretap-start** project

Step1

1) Open using-wire-tap.xml and observe the configuration

2) When ever a message is coming to orderschannel, we want that message to be copied to another channel with name loggingchannel

Configure a direct channel with name "loggingchannel"

3) Configure wire tap as an interceptor to orderschannel as shown below :

```
<int:channel id="orderschannel" >
        <int:interceptors>
                <int:wire-tap channel="Loggingchannel"/>
        </int:interceptors>
</int:channel>
```

4) we want to log all messages are coming to loggingchannel .

So, Configure a logging-channel-adapter ass below :
```
<int:logging-channel-adapter channel="Loggingchannel"
        level="INFO"/>
```

Now run WireTapDemo.java and observe that order.toString() is logged.

5) Now modify the logging-channel-adapter to log only customerID of payload

Congratulations !! You know how to use Wire Tap
